

haves), I once had to choose between:

Dimension \ Option	Option	
	A: Analytics	B: Integration
Business Impact	✔ Strong differentiation	Comparable to competitors
User Impact	✔ Better user experience	Similar value with other apps

A decision framework that works for 80% of scenarios

↗ Skills

🚩 Product Strategy

I've been asked in almost every product manager interview: "How do you make decisions, prioritize, or evaluate trade-offs?"

Over the years being a PM, I realized that most product decisions follow a similar logic. I use a decision framework that works for 80% of scenarios, and I adapt it by adjusting dimensions depending on the situation.

I use a decision framework that works for 80% of scenarios.

When deciding what to include in an MVP (beyond must-haves), I once had to choose between:

Option Dimension	Option	
	A: Analytics	B: Integration
Business Impact	✔ Strong differentiation	Comparable to competitors
User Impact	✔ Better user experience	Similar value with other apps
Risk	Limited data in the beginning	No pull factor to attract users
Feasibility Cost ...	Similar in this case	

The core dimensions I use are:

Business impact

- How much does this contribute to key metrics (revenue, growth, conversion)?

User impact

- How does this improve usability, efficiency, or overall experience?

Feasibility

- How does the current team realistically build this?

Cost

- Engineering effort, infrastructure, and operational cost

Risk

- What potential negative impact could this have on the above dimensions?

Depending on the situation, each dimension carries a different weight.

-

For example: When deciding what to include in an MVP (beyond must-have features), I once had to choose between:

A. Advanced analytics:

- Strong product differentiation and better user experience
- But risk of low initial value due to limited data

B. Better tool integration

- Comparable functionality to major competitors
- But no clear differentiation and thus no strong pull factor for users due to high switching costs

Both options were feasible and required similar effort.

Put everything on the table and the real question became simple. Using the framework helped me and stakeholders clearly see the trade-offs and align before making the decision.
