How I used data to connect business goals and product decisions

↗ Skills

Product Strategy,  Data Analysis

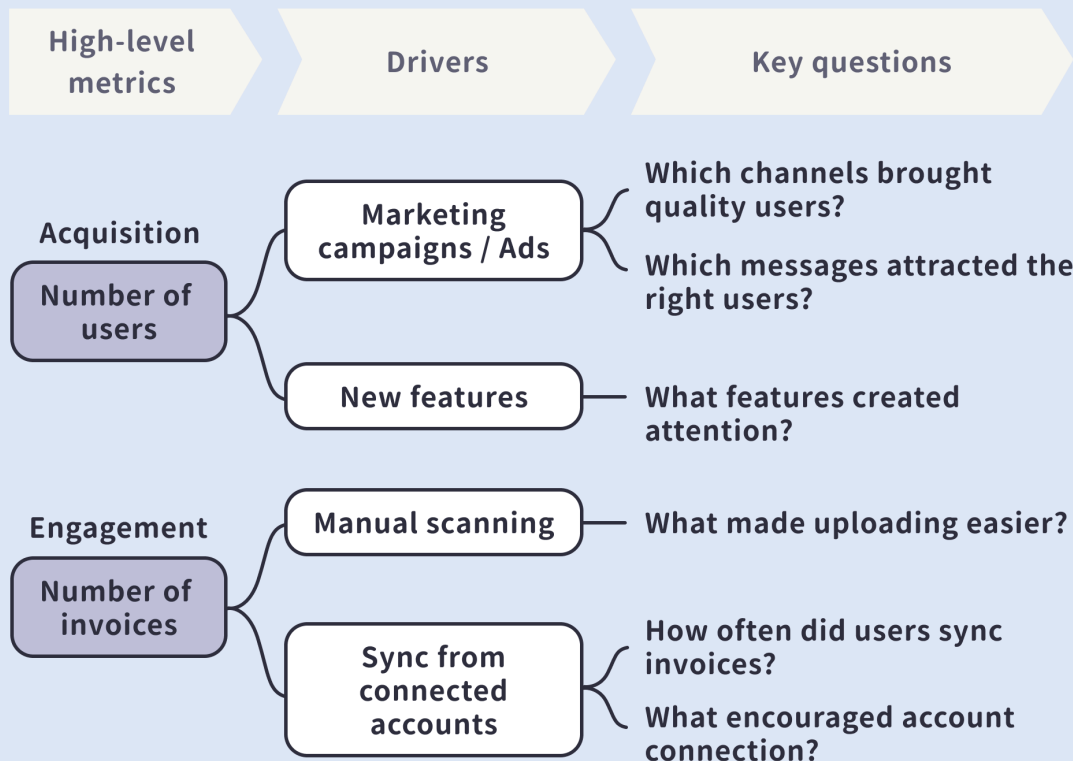

When I first started as a PM, I didn't have years of product instinct to rely on yet, but there was one thing that helped me build credibility early on:

I learned to speak with data.

I developed a structured way to approach data that I've used in almost every product since.

How I used data to connect business goals and product decisions:

Our business goal was to increase engagement, so I translated it into metrics the team could act on.

1. Connect business value to product metrics

Take LINE Invoice as an example, our product vision was to increase engagement inside LINE. So the question became: What does engagement mean in measurable terms?

For us, it meant:

- number of active users
- number of invoices uploaded (a proxy for real usage)

This helped us move from a vague business goal to something we could actually track and improve.

2. Break down high-level metrics into actionable drivers

High-level metrics are not actionable, so I broke them down:

- Users could come from marketing campaigns, ads, or product-driven growth through new features and entry points.
- Invoices could come from manual scanning or automatically sync from connected accounts.

This breakdown helped us understand where growth could actually come from.

3. Identify where to improve and validate with data

Once we had the breakdown, we could focus on more specific questions:

- User growth: Which campaigns brought users? What ads drove engagement? What features created attention?
- Usage growth: Where did users get stuck? What made invoice uploading easier? What encouraged repeat usage?

Different questions needed different metrics. For example, to understand usage behavior, we looked at page visits, usage rates, time spent, and drop-off points.

Data helped me think more clearly, understand user behavior better, and make decisions with more confidence. Even without years of experience, this method gave me a way to speak with clarity and earn trust.

It's still one of the habits that shapes how I work as a PM today.
