**I launched a product into a crowded market.
This is how I formed the product strategy:**

70% - New users

Reduce friction by:

1. Making it accessible
2. Simplifying onboarding

30% - Experienced users

Add new value by:

1. Discovering hidden needs from user research
2. Building product differentiation

I once led a product launch into a market with competitors already everywhere, and based on common sense we were probably too late.

But when we looked at the data, we found 70% of the potential customers still hadn't used any competitors' solutions yet.

Then I realized that: the problem wasn't competition. It was adoption.

So I focused on two strategies:

For the 70% who never used any competitors' solutions, we reduced the barrier to first-time use. We made it a web solution, so it solved users' concerns of taking up additional storage space, and simplified the onboarding flow.

For the 30% who were experienced users, we created value by delivering features that no competitors offered. We found hidden needs by conducting user research, and made them our unique value proposition that stood out.

The result:

- We gained hundreds of thousands of users in the first year
- Users were satisfied with the simplicity and the unique features we provided

From this experience I learned:

To succeed in an established market, finding the right product positioning plays the main role, and decision-making supported by data and user feedback is key to getting there.
